

3D Computer Graphics

Shading 1 (Illumination, Shading and Graphics Pipeline)

Dr. Zhigang Deng

UNIVERSITY *of* HOUSTON

DEPARTMENT OF COMPUTER SCIENCE

Today

- Visibility / occlusion
 - Z-buffering
- Shading
 - Illumination & Shading
 - Graphics Pipeline

Hidden surface elimination

- We have discussed how to map primitives to image space
 - projection and perspective are depth cues
 - occlusion is another very important cue

Back face culling

For closed shapes you will never see the inside

- therefore only draw surfaces that face the camera
- implement by checking $n \cdot v$

Painter's Algorithm

Inspired by how painters paint

Paint from back to front, **overwrite** in the framebuffer

[Wikipedia]

Painter's Algorithm

Requires sorting in depth ($O(n \log n)$ for n triangles)

Can have unresolvable depth order

Z-Buffer

This is the algorithm that eventually won. Idea:

- Store current min. z-value **for each sample (pixel)**
- Needs an additional buffer for depth values
 - frame buffer stores color values
 - depth buffer (z-buffer) stores depth

IMPORTANT: For simplicity we suppose

z is always positive

(smaller z -> closer, larger z -> further)

Z-Buffer Example

Rendering

Depth / Z buffer

Image source: Dominic Alves, flickr.

Z-Buffer Algorithm

Initialize depth buffer to ∞

During rasterization:

```
for (each triangle T)
  for (each sample (x,y,z) in T) if (z <
    zbuffer[x,y])                                // closest sample so far
    framebuffer[x,y] = rgb; zbuffer[x,y] =      // update color
    z;                                           // update depth
  else
    ;                                           // do nothing, this sample is occluded
```

Z-Buffer Complexity

Complexity

- $O(n)$ for n triangles (assuming constant coverage)
- How is it possible to sort n triangles in linear time?

Drawing triangles in different orders? Most important

visibility algorithm

- Implemented in hardware for all GPUs

Today

- Visibility / occlusion
 - Z-buffering
- Shading
 - Illumination & Shading
 - Graphics Pipeline

What We've Covered So Far

Position objects and the camera in the world

Compute position of objects relative to the camera

Project objects onto the screen

Sample triangle coverage

What Else Are We Missing?

UNIVERSITY of HOUSTON

DEPARTMENT OF COMPUTER SCIENCE

Shading

Shading: Definition

* In Merriam-Webster Dictionary

shad·ing, ['ʃeɪdɪŋ], noun

The darkening or coloring of an illustration or diagram with parallel lines or a block of color.

* In this course

The process of **applying a material** to an object.

A Simple Shading Model (Blinn-Phong Reflectance Model)

Perceptual Observations

Specular highlights

Diffuse reflection

Ambient lighting

Shading is Local

- Compute light reflected toward camera at a specific **shading point**

Inputs:

- Viewer direction, v
- Surface normal, n
- Light direction, l
(for each of many lights)
- Surface parameters (color, shininess, ...)

Shading is Local

No shadows will be generated! (shading \neq shadow)

Diffuse Reflection

- Light is scattered uniformly in all directions
 - Surface color is the same for all viewing directions

Diffuse Reflection

- But how much light (energy) is received?
 - Lambert's cosine law

Top face of cube
receives a certain
amount of light

Top face of 60°
rotated cube
intercepts half the
light

In general, light per unit
area is proportional to
 $\cos \theta = l \cdot n$

Light Falloff

Lambertian (Diffuse) Shading

Shading **independent** of view direction

Lambertian (Diffuse) Shading

Produces diffuse appearance

$k_d \longrightarrow$

[Foley et al.]

Thank you!

(And thank Prof. Lingqi Yan, Prof. Ravi Ramamoorthi and Prof. Ren Ng for many of the slides!)
